Abstract (en)
[origin: DE4125432A1] A control system for operating the drive assembly of a ship has an engine (1), a gear (3) and an adjustable clutch (4) for forward and reverse motion. A control station (15), a control lever (27) and control electronics (15) allow the direction of motion and the speed of the ship to be adjusted. In order to influence the reaction of the ship when changing direction, the ship pilot can use several direction reversing aids by actuating a selection key (24) arranged at the control station.
