Abstract (en)

[origin: EP0596240A1] A device for transmitting measured values via a high frequency radio link is proposed which contains a first receiver and at least one second receiver. The transmitters (10) transmit simultaneously on different prescribable high frequency channels. The first receiver (22) is provided to interact with at least two transmitters and is tuned in a chronological sequence to the high frequency channels corresponding to the transmitters (10). The second receiver (23) is provided for interaction with a further transmitter (10) and is permanently tuned to a high frequency channel corresponding to the transmitter (10). The device according to the invention is particularly suitable for measuring operations in which different measured values are successively processed in a chronological sequence, it being however necessary for one measured value with a high transmission rate to be available at the same time. <IMAGE>
