Abstract (en)

[origin: EP0598695A1] The shuttering system, especially for building homes, is characterised in that the walls are arranged in plan between the framework nodes of a network, and in that the width of all the rims is limited by the distance (A) between two axes, and in that the lengths remain limited to three axial distances, the framework nodes being used as fixed measures for the linkage anchors (1) in the ceiling slabs (2) and being important for transport and fastening by screwing the removable shuttering unit for the size of a room consisting of shuttering panels (4), for the height of the room and being integrated with their frames assembled by articulated boxes (5) with a support structure (6) made spatially rigid and carrying the fastening (12) at the corners, without possibility of horizontal movement, of the corner bracket (11) with its articulation (10), whilst the shuttering of the outer wall bears on a shuttering for the height of the slabs fixed by screwing to the vertical linkage anchors (3). <IMAGE>
