Abstract (en)
[origin: EP0599041A1] The invention relates to an interface device between a ski (1) and bindings (binding elements) (3, 4) which are intended to hold the ends of a boot on a ski. The device comprises a longitudinal plate (15) which extends over the ski in the underfoot zone. One end of the plate (15) is connected to the ski by a link (17, 18, 19) which permits free sliding of the said end with respect to the ski. A stop blocks this sliding movement beyond a specific flexing of the ski. The other end of the plate is connected to the ski by a link (30, 33, 31) which can deform upon stretching in an elastic manner in a longitudinal direction. This link consists of a layer of adhesive (33) which has both adhesive qualities and stretching qualities. <IMAGE>
