Abstract (en)
[origin: EP0599163A1] A liquid-ring machine with a housing, in which an impeller is arranged rotatably and is offset with its axis (6) by an amount of eccentricity (8) relative to the axis (7) of the housing, is to be capable of being used in a simple way to the best possible effect both for vacuum operation and for compressor operation. This is achieved in that this amount of eccentricity (8) is counter to the direction of gravity during vacuum operation and in the direction of gravity during compressor operation. <IMAGE>
