Abstract (en)

[origin: EP0599804A2] Safety securing device for a shoe, having an outer shell (22) connected to a sole (24) which is provided for co-operation with the jaws of a safety securing device, especially a safety ski binding, the shoe (1) being provided with at least one measurement transducer (S1, S2) connected to an evaluation circuit which is itself connected to a release device belonging to the safety securing device and responding to electrical signals. In order to avoid the influence of force shunts, having changing coefficients of friction, during the recording of the loads, provision is made for providing the outer shell (2) with a base (24) which is connected to the sole (20) via an elastic intermediate layer (23), and for arranging the measurement transducer (S1, S2) between the sole (20) and the base (24) of the outer shell (22). <IMAGE>
