Abstract (en)
[origin: EP0600153A1] The invention relates to a contact sleeve (bush, tube) for insertion in a recess (6) of a support component (2) of a measurement mechanism, which contact sleeve can be electrically connected to the measurement mechanism. In this arrangement a contact screw (12) can be screwed into the recess, by which screw a printed circuit board (11) can be pressed into contact against a frontal opening region of the recess (6). A wiring path region (17) of the printed circuit board (11) can thereby be electrically connected to the contact sleeve (7). The contact sleeve (7) has, on its end facing the printed circuit board (11), a flange-like extension extending approximately radially outwards, which extends into the frontal opening region of the recess (6) between the support component (2) and the printed circuit board (11) which can be pressed onto it.
