Abstract (en)

[origin: EP0600188A1] The drivers (2) of the horizontally mounted laundry drum (1) have an asymmetric cross-sectional profile which at least resembles an asymmetric parabola. The process for operating such a washing machine is characterized by the rotation of the laundry drum (1) in different directions of rotation which are assigned to more or less widely differing operating segments as a function of the programme stage (wetting phase, washing phase, spinning phase) and of the type of textile. <IMAGE>
