Abstract (en)

[origin: EP0600216A1] Folded printed products (20) are held at their fold in a suspended position and are transported supported in their end region (30) remote from the fold. The end section (32) of the first product part (22) which projects relative to the second product part (24) is gripped by a gripper (44), driven in circulation, and held temporarily. An insertion element (54), which is driven at a different speed in relation to the gripper (44), is then inserted in the printed product (20) and, while the gripper (44) and the insertion element (54) are moving away from one another, lifts the second product part (24) from the held first product part (22). When the printed product (20) is open, the gripper (44) releases the first product part (22). <IMAGE>
