Abstract (en)

[origin: EP0600231A1] A device for fixing printing plates in a registered position on the plate cylinder of sheet-fed offset printing machines, having a clamping bar (3) assigned to the lead edge of print and arranged fixedly in the cylinder gap as well as a clamping bar assigned to the tail edge of print is to be improved in such a way that the printing plate is prevented from lying with a hollow in the region of the bend at the lead edge of print. The clamping bar (3) assigned to the lead edge of print is assigned a bending device (12) in addition to a remote-control actuating device (13) by means of which the clamping bar (3) can be pushed a given distance away from the lead edge of print under elastic deformation - after the printing plate has been fixed from the tail edge of print. <IMAGE>
