Abstract (en)

This invention concerns a novel breathable, buoyant, thermal insulator material. The insulator material of the invention comprises an assemblage of: (a) from about 50 to 100% by weight of spun and drawn polymeric microfibers having a diameter of from about 2 to 14 microns; and (b) from about 0 to 50% by weight of synthetic polymeric binder fibers having a diameter of from about 12 to 50 microns, wherein the resulting assemblage has a density of from about 3.0 to 10.0 lb/ft³, and apparent thermal conductivity k measured by the plate to plate method according to ASTM C518 with a heat flow down of less than about 0.3 Btu.in/hr.ft<2>. DEG F in the dry condition, water absorption less than 50% of its dry weight when immersed for one hour at a depth of 2 ft. in fresh water at a temperature of 70 DEG F, a buoyancy greater than 40 lb/ft<3> after immersion for one hour at a depth of 2 ft. in fresh water at a temperature of 70 DEG F, and an intrinsic moisture vapor transfer rate of at least 100 times greater than that of a closed-cell foam according to Military Specification MIL-P-12420C, Type II, Class 6. <IMAGE>
