Abstract (en)

[origin: EP0600845A2] At a freezer display cabinet (10), where a cooling element (22) cools the air for a vertical air curtain (26), which in its turn cools goods in the cabinet to freezing temperature (about -18 DEG C), one lets the air also flow through the goods from the rear for further cooling of the goods. At defrosting of the cooling element heated air is circulated through the cooling element (22) and the curtain (26), while the air flow from the rear through the goods is shut off, so that humid defrosting air cannot form frost on the goods here. <IMAGE>
