Abstract (en)
[origin: EP0602350A1] The invention relates to an interface device between a ski and front and rear bindings. The device comprises a longitudinal plate (15) on which the front (3) and rear (4) bindings are assembled. One end of the plate (15) is connected securely to the ski and the other end (19) is assembled via a link (20, 21) which is elastically deformable in a longitudinal direction. Moreover, a rigid wedge (26) is interposed between the plate (15) and the upper surface of the ski in the zone of mounting of the front binding (3). Preferably, a layer of elastically compressible material (25) is located between the plate and the ski, in the rear part. <IMAGE>
