Abstract (en)
[origin: WO9303655A1] An object-supporting device, such as a device for supporting a flat signboard, a photograph frame or the like intended to be used in an upstanding position while supported by the support device, the device being intended to take a generally flat first position, transport and storage position, conforming to the configuration of the object, and a second position, a supporting position, in which part of the device extends from the object to form a support part which is intended to lie against an underlying surface. The object-supporting device is characterized by at least one flexible and resilient, generally sheet-like support part (3) which includes an attachment part (4) which is intended to be attached to the object (1) to be supported, and at least one tongue-like part (5) having a free-end (6) which preferably faces towards the attachment part (4) in a first position, wherein the free-part of the support-part is intended to be bent outwards away from the object (1) to place the device in the object-supporting position, and wherein the tongue-like part (5) is intended to be bent inwardly so that its free-end (6) abuts the object and therewith holds the support-part (3) in its outwardly bent position.
