Abstract (en)
[origin: EP0603465A1] The invention relates to a method and a device for optical presentation of information by means of a plurality of projection modules on a transparent projection surface using transmitted-light projection. The object, to develop a method and an arrangement of the generic kind which is cost-advantageous and ensures a bright, high-contrast, homogeneous image for the viewer, is solved in that each projection module consists of a light source which has a divergent beam path and transilluminates a controllable light valve, and, arranged behind it, the projection surface. The distance between the light valve and the projection surface is selected such that the part images of neighbouring modules, which are projected onto the projection surface, border each other without gaps. <IMAGE>
