Abstract (en)

[origin: EP0604388A1] A device for controlling the combustion air supply for a stove, in particular a tiled stove, has a sealing member (3) which is arranged in the doors (1) of the combustion chamber or in an air supply duct opening into the combustion chamber. The device is provided with a temperature sensor (9) arranged in the combustion gas path of the stove and with a lambda probe (6) which is likewise arranged in the combustion gas path of the stove. Both the temperature sensor (9) and the lambda probe (6) and also a safety device (11) which can be operated from the doors (1) of the combustion chamber are operationally connected to a control device (8) which is coupled to an adjusting device for the sealing member (3) in such a way that depending both on the temperature in the firing chamber and on the residual oxygen content in the combustion gas an optimum amount of combustion air is fed to the combustion chamber (Fig. 1). <IMAGE>
