Abstract (en)
[origin: WO9302589A1] An instrument for selectively decolorating locks of hair compris e a pair of jaws (1, 2) capable of closing one upon the other through a pincers' movement and defining a channel therebetween into which a selected lock of hair, previously laid over one jaw may be gripped. An injection mechanism (13) injects a preestablished quantity of dyeing liquid inside the channel defined between the two jaws for wetting the lock of hair. Preferably one (2) of the two jaws has an internal surface contacting the hair which is electrically heated (17) for accelerating the dyeing process of the lock of hair. The instrument permits to perform a lock-by-lock treatment for producing a so-called coups-de-soleil effect without the need to use a protection cap for the rest of the hair.
