Abstract (en)

[origin: EP0604673A1] In the known winding devices, the winding bobbins are guided with a horizontal axis according to the web to be wound which lies flat. This leads to difficult movement operations which are to be carried out on the winding bobbins and which impair the automatic winding. In order to avoid this and moreover reduce the size of the floor space, it is proposed, according to the invention, to mount the winding bobbins horizontally within the winding device and also to carry out the winding on a horizontal winding bobbin lying on a sliding/rolling plate (5). <IMAGE>
