Abstract (en)

[origin: DE4125330A1] The aim of the invention is to provide a process for the production of dense granular zeolites, the amount of granulation liquid used representing less than the critical amount already known in the art, thus enabling (co)polymeric carboxylates to be used as the dissolved constituent of the granulation liquid. In the process proposed, granular materials consisting of a zeolite and sodium or potassium salts of polymeric or copolymeric carboxylic acids, with a bulk density of 750 to 1000 g/l, are produced by granulation with the addition of a granulation liquid, part of the zeolite being added in spray-dried form and at least 90 % of the zeolite particles having a diameter of between 50 and 700 μm , and the granulation liquid containing a mixture of water, zeolite and (co)polymeric carboxylates.
