Abstract (en)

[origin: EP0605758A1] The ski boot (St) front part is supported from underneath for cross-country skiing by a support mounting (1) in the form of a tread plate movable on a pivot axle (4). An adjustable tension piece with movable clamp (6) exerts clamping pressure on the ski boot and fixes it on the support mounting. For downhill skiing, a sole holder (2) attaches the ski boot front part to the ski (Sk) and incorporates components absorbing the upward and forward directed forces on the ski boot and fixed to the ski by means of a joint base (3). The tread plate side facing the ski boot sole (So) for cross-country skiing has a protuberance (5) fitting into a matching cavity (A) in the sole.
