Abstract (en)
[origin: EP0605782A1] A description is given of a device for the positively locking and frictionally locking coupling of lock-case-front rails by means of a connecting plate having a fine-toothed strip which is directed towards the lock-case-front rail, which can be coupled to one such rail via a fine-toothed arrangement formed on slot inner walls and to the other rail via cutouts on the longitudinal borders. In this arrangement, the connecting plate provided with the fine-toothed strip and with coupling attachments is secured on the lock-case-front rail exhibiting the slot with the fine-toothed arrangement via a clamping/sliding connection, and at least the coupling connections supported on the lock-case-front rail are retained in a basic position in which the fine-toothed arrangements of lock-case-front rail and connecting plate can be disconnected and displaced in parallel with respect to one another via the clamping/sliding connection.
