Abstract (en)

[origin: EP0606054A2] In a conveying device for propelling gases and liquids in a flow channel, the conveying characteristics are improved by the use, for the rotation of the impeller 3, of a driving device which consists of a stator 6 and an armature 1. The armature is designed as a ring which concentrically surrounds the impeller 3, which can be rotated about an axis 2, and, with the impeller 3, forms a unit. Alternatively, an outer and an inner impeller are provided, the outer impeller, which is driven by a motor, driving by its rotation the smaller, inner impeller, via a gear mechanism.
