Abstract (en)

[origin: EP0606935A1] The invention relates to a cap for an aerosol can (1) provided with an outer shell (7), which is at one end provided with an upper wall (8) extending perpendicularly to the outer shell (7), on which the upper end of an inner shell (9) surrounded by said outer shell (7) joins. The length of the inner shell (9) is less than the length of the outer shell (7) and the inner shell (9) is provided with a flange (18) on the inside, at its bottom edge remote from the upper wall (8), which flange (18) is designed to engage under a bead (5) forming part of an aerosol can (1). Connecting means (15) are provided between at least two substantially diametrically opposed and resiliently compressible parts of the outer shell (7) and the inner shell (9), which connecting means (15) join on the inner shell (9) in two at least substantially diametrically opposed points. Recesses (16) are provided in the bottom edge of the inner shell (9), near the points of joining of the connecting means (15) on the inner shell (9), in such a manner that the flange (18) provided on the inside of the inner shell (9) is interrupted near the points of joining. <IMAGE>
