Abstract (en)
[origin: EP0607543A2] The invention relates to a ski to whose upper side base-plates of ski binding parts can be fixed by means of a plurality of screws anchored in the ski body, vibrations of the ski body being damped by at least one damping layer. In order to provide a ski (1) whose structure is designed as desired but which nevertheless has good damping of the vibrations arising in the ski body during movement, the invention makes provision for the screws (9) to be arranged with the interposition of bushings (8) which bear on the upper side (1a) of the ski (1) and for the damping layer (2) to be located on the upper side (1a) of the ski (1) and be protected by a masking plate (3) which is fixed to the ski (1) at one end (3a) and is displaceably guided at the other end (3b) the masking plate (3) having slots (3c) extending in the longitudinal direction of the ski in the region of the individual bushings (8). <IMAGE>
