Abstract (en)

[origin: EP0609191A1] In an apparatus for the thermal cracking of a mixture of liquid and gaseous hydrocarbons, at least one pipe (R3) for the mixture leads into a heat exchanger (W1) which is connected, if appropriate, for fluid conduction to a pipe (R4) leading out of the heat exchanger via a by-pass line with a controllable isolation valve (V1) in the through-flow, the pipe (R4), which leads out of the heat exchanger (W1) and into which at least one further pipe (D1) for superheated steam leads, leads in turn into a further heat exchanger (W2) whose outlet line (R5) leads into a downstream heat exchanger (S), if appropriate with a catalyst, whose outlet line (R6) leads into a cooling and separation device (K+A), at least one gas separator for separating off a gaseous fraction from the mixture being provided upstream of the heat exchanger (W1), as viewed in the direction of flow, and the by-pass line, being a gas line (G1) which has a controllable isolation valve (V1) in the through-flow and leads out of the gas separator (G) into a further heat exchanger (W2, S, D), in particular via the further pipe (R4). <IMAGE>
