Abstract (en)
[origin: US5413742A] A post-mix beverage preparation and dispensing unit includes a carbonator tank coupled to a feed water branching circuit. The branching circuit selectively feeds fresh water from a pressurized fresh water source to the storage tank where the water is mixed with CO₂ gas and is fed to a concentrate mixing station or it feeds fresh water through a heat exchanger which is coupled to the cooled carbonated water of the carbonator tank to cool a supply of fresh water which is then delivered to the same mixing station along with the proper concentrate of the proper amount. A selected beverage is delivered to a dispensing station and can either be a carbonated beverage or a non-carbonated beverage depending on the desire of the consumer.
