Abstract (en)
[origin: EP0609438A1] The gearbox has a series of discs (1-4) arranged parallel. On diametral planes of the said discs oriented towards one another cylindrical rings (6-20) with engaging elements on the internal and external cylindrical surfaces are supported concentrically with their axes of rotation. Through displacement of the adjacent discs (1-4) resulting in an eccentricity E1, E2, E3 between their parallel axes of rotation, all rings (6-20) arranged in the space between the diametral planes of the said discs (1-4) are brought into constant engagement. Each ring (6-20) is freely rotatable and designed with controllable locking relative to the disc (1-4) supporting it. <IMAGE>
