Abstract (en)

[origin: EP0609526A1] The link connector is for a frame containing a C-section undercut inside groove (10-12). A body (8) on the front of the frame has a claw (23) or hooked nut by which it is clamped in the undercut, while the body covers the groove on the outside. The claw is clamped in the groove in the transverse direction by a component actuated from the front. The body bears against the middle of the groove bottom and clear of the front undercut (11). The actuating component can be a screw (21,22) engaging in a tapped hole in the claw or nut. There can be a protrusion (20) on the body, engaging in the rear undercut (12), and the claw can be guided by a recess in the body at right angles to the groove.
