Abstract (en)
[origin: EP0609545A1] The invention relates to a construction element for thermal insulation between a building and a projecting outer part, comprising an insulating body (1) which is to be laid therebetween and has integrated metallic tensile-force bars (2), compressive-force bars (3) and shearing-force bars (4), which extend through said insulating body (1), transversely thereto. In this arrangement, the shearing-force bars (4) are bent in hose form (4a) on the outer side (B), which is to be concreted, of the respective insulating body (1) and are connected to the compression bars (3) via a distributor bar (5) running parallel with respect to the insulating body.
