Abstract (en)

[origin: EP0609784A1] In a foldable packaging container with a bottom panel and with transverse and end walls (16) starting from the latter and separated from it by bending lines (24, 26) or such like weakening lines, the said packaging container being cut to size from a cardboard sheet, the transverse and end walls (18) are folded up at an angle to the bottom panel (14) to form a frame, surrounding the latter, for a receiving cavity (36), two transverse walls of adjacent packaging containers, as part of the material web, being separated respectively by a folding line (22). This packaging container forms, with a plurality of further identical individual containers (12), a packaging box (10) extended in a bar-like manner, and the individual containers (12) are separated from one another by the folding lines (22) of the material web, the adjacent transverse walls (18) of respectively two individual containers being movable relative to one another about a constructive hinge axis (B) drawn through the folding line. <IMAGE>
