Abstract (en)

[origin: EP0611807A1] A photographic material is disclosed comprising a support, at least one silver halide emulsion layer, and optionally one or more non-photosensitive hydrophylic layer(s), characterized in that at least one of said emulsion layer(s) and/or non-photosensitive layer(s) contains a triphenylmethane dye, absorbing around 670 nm, represented by general formula (I'D) : <CHEM> wherein R<1> and R<2> each independently represents hydrogen unsubstituted or substituted alkyl, or unsubstituted or substituted aryl, R<3> represents an electron-withdrawing group, and the substance contains at least two water-solubilizing groups, and X<-> represents an anion, or an intramolecular anionic group. on triphenylmethane dyes can serve as filter dye, acutance dye, or anti-halation dye. The claimed photographic materials are especially suited for exposure by a laser diode emitting at 670 nm.
