Abstract (en)

[origin: US5428932A] A wall panel, especially double-wall panel, for building a large shuttering wall, from a plurality of wall panels whose lateral abutment edges flushly abut each other, the wall panel comprising a main plate having rectilinear first and second lateral abutment edges parallel to each other on a first large face of the main plate. On the other large face of the main plate a platelike suspension tooth obliquely and descendingly projecting from the first abutment edge is arranged behind the first abutment edge, while a suspension recess adapted to the suspension tooth is arranged behind the second abutment edge. Thereby, the wall panels can be slidingly suspended into each other, until the abutment edges of the two wall panels adjoining each other come into contact with one another.
