Abstract (en)
[origin: EP0611942A2] In this case, it is provided for a parallelogram linkage to be constructed between the mounting, the vehicle roof and a hatch which can pivot, in order to adjust the mounting from a lowered stowed position into an erected operating position, by means of a pivoting movement of the hatch. In this case, an upper base of the parallel linkage is formed via spaced-apart bearing points on the mounting and a lower base is formed by spaced-apart bearing points on the vehicle roof, which are connected in an articulated manner by connections in the form of a linkage arm and the hatch which can pivot. <IMAGE>
