Abstract (en)

[origin: EP0612484A1] The device comprises a tensioning lever (1) which acts on at least one tension member, such as a cable (12). The tensioning lever is designed so that the point of attachment (11) of the cable moves on the tensioning lever when the latter is rotated, and so that this attachment point coincides with the axis (2) of articulation of the tensioning lever after a defined angle of rotation of the tensioning lever from one of its stable positions. This construction allows perfect control of the course of the attachment point. In the case when the tensioning lever has two functions, that is to say that it acts on two cables, this construction allows the functions to be sequenced. <IMAGE>
