Abstract (en)

[origin: EP0612886A1] The invention relates to a bridge consisting of at least two bridge elements (10.1, 10.2). Each bridge element consists of a base body (11) with bevelled end faces (13), on which carriageway slabs (14) lie, it being possible for the carriageway slabs to be brought in constrained fashion from a run-up position into a coupling position by means of articulated ramp plates (17; 17.1, 17.2) by in each case two bridge elements being moved up against one another into a run-up position with the ramp plates. The device (18.1) for placing the bridge has a guide (supporting rail 21, holding plate 22) for the guide pins (17.3, 17.4) of the ramp plates (17.1, 17.2), so that the bridge elements (10.1, 10.2) can be securely brought together. In addition, the device (18.1) has guide rails (27), with which the locking elements (hooks 28, bolts 38) can be centrally actuated. <IMAGE>
