Abstract (en)

[origin: WO9311036A1] A device for transfer of personnel or cargo between a fixed or floating installation and a boat in a high sea, comprises a boom which is pivoted around a horizontal axis on the installation and which projects over an area to which a boat deck can be manoeuvred. The boom is upwardly suspended and equipped with a longitudinal transport passage. From the boom's outer end a wire or rope connection can be dropped and connected with a boat deck in such a manner that the wire or rope connection when ready for use is stretched taut between the boat deck and the upwardly suspended end of the boom. The rope connection is kept taut and at an approximately constant length since the boom's suspension follows the boat's movements in the waves. The rope connection controls transport devices between the end of the boom and the boat deck in the form of a rescue sock, slide or lift.
