Abstract (en)
[origin: EP0615775A2] Game apparatus has a transparent enclosure (1) containing a die (2) having distinct faces (21). The die can be thrown in the enclosure to tumble freely and fall on any one of its faces (21). The floor of the enclosure has a sensing surface (31) having radiation emitters/sensors (A-E) aligned with possible locations of distinguishing spots of the die faces. By reading the die face which lands against the sensing surface (31), the orientation of the die (2) and in particular the value of its displayed upper surface can be identified and displayed electronically. Also disclosed is the use of sloping guide plates (50) to guide the die (2) down into alignment with the sensing surface. Such guides may be used also with other forms of face identification, using e.g. capacitive or inductive face identification. <IMAGE>
