Abstract (en)
A hinge pivot (5) can be secured to one of the two associated bosses (1,2) by means of a mechanical restraint (9) comprising a plunger (10), preferably a ball, freely accommodated in a radial socket (11) afforded by a lower part of the pivot (5) and opening onto its cylindrical surface; the plunger (10) is operated by an adjustment mechanism (12) comprising a screw (13) seated in the bottom end of the pivot (5) with the head (13t) accessible from externally of the relative boss (1,2), which, with the pivot (5) inserted, can be turned one way and the other to select a non-operative limit position in which the ball (10) lies completely within the socket (11), and an operative limit position in which the ball (10) emerges marginally from the socket, protruding beyond the surface of the pivot (5) and entering forcibly into contact with the inside wall of the boss (1,2). <IMAGE>
