Abstract (en)

A method of processing an exposed originating silver halide color photographic element comprising developing the photographic element in a color developer containing a p-phenylenediamine color developing agent in the presence of a 1-phenyl pyrazolidin-3-one compound wherein the originating silver halide photographic element comprises a radiation sensitive emulsion in reactive association with a development inhibitor releasing compound and containing a silver halide grain population comprised of at least 50 mole percent chloride, based on total silver forming the grain population projected area, wherein at least 50 percent of total grain projected area is accounted for by intrinsically stable tabular grains (1) bounded by {100} major faces having adjacent edge ratios of less than 10 and (2) each having an aspect ratio of at least 2, and wherein the silver halide content of the photographic element comprises at least 50 mole % silver chloride and no more than 2 mole % silver iodide. <IMAGE>
