Abstract (en)

[origin: EP0618138A1] The printed product (16) is introduced from above into the shaft (52) and between the fingers (56) and is positioned in such a way that it is arranged approximately symmetrically relative to the axis of rotation (54') of the fingers (56). When the fingers rotate in the direction of the arrow, the printed product is folded in a S-shaped manner by cooperation with elastic belts (114,116) and is thus brought into a tubular shape. A foil-like holding element (34) is also wound on, in order to wrap the printed product (16) and keep it in the tubular shape. <IMAGE>
