Abstract (en)

[origin: EP0618153A1] The invention relates to an interchangeable, tiltable, stackable transport container (1) for differently flowable and/or pourable materials, such as rubble, refuse and the like. A flap (18) and/or door closes one end face (13) of the transport container (1) and is attached so as to be pivotable and to rest flush against the bottom (6) of the transport container (1). The purpose of the invention is to design the transport container (1) in such a way that effective disposal of a waste component is always possible using said container in each case and different waste components can be received separately yet transported together. For this purpose, a flap (4) is also provided on the opposite, second end face (3), which flap can only be opened into the interior (2) of the transport container (1). Provided on the outer surface of the bottom (6) of the transport container (1) are standing rails (7), between which a tilting bearing (19) is provided at the ends of said rails in the region of the first end face (3). <IMAGE>
