Abstract (en)

[origin: EP0618154A1] The invention relates to an interchangeable, tiltable, stackable container (1) for differently flowable particulate materials like rubble or refuse. On one end face of the container (1) a closable flap (5) and/or door (16) is provided, fastened to the container base (12) in a manner flush with the latter. The container (1) is to be designed so that different refuse components can be separately received by it and yet jointly transported. For this purpose, according to the invention the interior (2) of the container (1) is subdivided into at least two chambers (3) by at least one separately closable separating device (4) which can be moved out of and into the closed position, in which chambers the different components can be separately received, but jointly transported. <IMAGE>
