Abstract (en)

[origin: EP0618341A1] Device for protecting an opening such as a roller shutter (1) comprising a drum (4) driven in rotation by a motor unit (5) around which a shutter (6) or curtain is wound between at least two positions, and means (15) for controlling the position of the said shutter (6) which are fixed to the position of the drum (4). According to the invention, it comprises, mechanically coupled to the drum (4), at least one element (16) enabling the voltage and/or current to be varied at its terminals as a function of the position of the shutter, and means (17) which compare the signal delivered with at least two predetermined thresholds. <IMAGE>
