Abstract (en)
[origin: WO9311047A1] A novel type of folding packaging comprises a container (2) made from a semi rigid material and a rectangular wooden pallet (1) to which the container is rigidly attached. Said container comprises a bottom (7) rigidly attached to the pallet and a body (3) associated with the bottom and capable of being folded flat on the upper surface of the pallet, said body (3) having a parallelepiped shape and comprising four walls mutually hinged together at fold lines which form edges perpendicular to the surface. Two parallel walls (5) of said body also incorporate a central fold line (6) parallel to said edges, dividing them into two equal parts (5a-5b) so that they can be folded in concertina fashion between the other two walls. The bottom (7) consists of a dihedral insert having two articulated flaps (7a-7b) forming an edge Vee (10) parallel to the walls (4) of the body, these two flaps (7a-7b) being attached to the respective walls (4) by a section (8a) bonded or stapled to the walls (4) and articulated with the respect to the associated flap (7a-7b) by means of a fold line at the base of said walls (4) over the entire length of the base.
