Abstract (en)

[origin: FR2698026A1] The system comprises two matrices (2, 2') with recessed surfaces (6, 6'), linked together by crenellated edges formed by interlocking teeth which allow the matrices to be brought together, e.g. by hydraulic pressure, closing the space between them. The two matrices are identical in shape and fitted by reversing one relative to the other so that the teeth interlock. Each matrix recess is in the shape of a portion of a cylinder, so that a cylinder is formed when they are brought together, squeezing a component placed between them. The matrix teeth can have chamfered or slightly rounded edges for ease of engagement. USE/ADVANTAGE - More even compression, e.g. of ring fitted to pipe used to make a joint.
