Abstract (en)
[origin: EP0622096A1] The invention relates to a gliding (sliding) board, in particular a snowboard, which is intended to support both boots of a skier. The board comprises a base structure (4), at least the front end of which is raised to form the tip. It also has a central zone (12) with two zones (15), (16) for mounting the bindings, a front zone (13) and a rear zone (14). It is characterised in that it has, at least in one of the front or rear zones (13), (14), a longitudinal reinforcement (20) which is profiled along the length and the width of the said zone. The reinforcement extends from the vicinity of the end of the front or rear zone (13), (14) up to at least the vicinity of the mounting zone (16), (15) located close to the zone. <IMAGE>
