Abstract (en)
[origin: EP0622813A1] The invention relates to a resistive element consisting of a strip of resistive material in which slots (18, 19, 20, 21) are formed, according to a defined pitch, delimiting at least one zig-zag electrical circuit between two ends (11, 12) of the resistive element serving as electrical connections, characterised in that the said slots are inclined with respect to an axis passing through the said electrical connections by an angle with a value determined so as to confer the desired electrical resistance on the said resistive element. Application to braking rheostats.
