Abstract (en)  
The invention relates to a cutting apparatus comprising an endless chain body (2) having a plurality of plate-like flaps (1) connected to each other for angular movement in a common plane. Each flap (1) has a connecting protrusion (8) and a connecting recess (10), said connecting protrusion (8) having a disk shape and including an engaging protrusion elongating along the outer peripheral surface thereof. The connecting protrusion (8) of each flap (1) is fitted into said connecting recess (10) of the adjacent flap (1), a pair of engaging portions of each connecting recess (10) holds said engaging protrusion of said connecting protrusion (8) of the adjacent flap (1) to prevent disengagement of the flaps (1) from each other in a direction perpendicular to the common plane, said connecting protrusions (8) and said connecting recesses (10) of said flaps (1) connecting said plurality of flaps together for angular movement in a common plane. At least some of said flaps (1) have said cutting device (4) located at the outside edge of said flap (1). <IMAGE>
