Abstract (en)

[origin: EP0623465A1] The invention relates to a device for processing viscous or highly viscous fluids for finishing printed products in a finishing unit on a rotary printing machine, the finishing unit comprising a plurality of rollers, which can be supplied at least at one feed point and cylinders which can be supplied by said rollers. The invention is characterised in that the supply of fluid to the lacquer-conducting cylinders (12, 13) takes place by means of a metering roller (2) which can be supplied either both via a roller (20) which can be pivoted into a first position (20') and via a feed roller (3) from a lacquer trough (10) or can be supplied from a part (26) of a roller, either between the metering roller (2) and the roller (20) which can be pivoted into a second position (20'') or between the metering roller (2) and a stationary roller (3, 4). <IMAGE>
