Abstract (en)

[origin: JPH06306749A] PURPOSE: To improve the intersecting point of a transport cart for receiving a loom harness transport device and the transport device itself in order to enable the start of a loop without the loss of productivity after a loom harness exchange by effectively executing the exchange of the loom harness. CONSTITUTION: The intersection point between the horizontal beam 2 and the transport cart 1 is formed by a centering means 10 having a simple shape. The supporting beam consists of a first horizontal beam 7 and a second horizontal beam 7. The horizontal beam sets are supported by a guide member or cruciform member 7 relatively vertically movable within a common transverse plane. The respective beam sets are so formed that the function constitution elements different from those known in the prior art are received.
